

Mental Health Issues for Introverts

Are you an introvert who has problems managing your moods, compulsions, addictions or ability to concentrate? Today there is increasing public awareness of both introversion, and mood disorders such as anxiety and depression, but there is limited awareness of how such problems specifically affect introverts. Scientific research shows introverts tend to suffer from higher rates of anxiety and major depression, and can also suffer from Attention Deficit Disorder and addiction issues, which are more commonly perceived of as being extroverts problems. Introverts are also more likely to suffer from chronic, mild to moderate problems such as low-grade depression. *Mental Health Issues for Introverts* is a clear and concise booklet that explains why introverts are more likely to suffer from mood disorders than extroverts, and describes the types of mental health problems that are more common among people with this personality trait. It also outlines scientifically-proven ways of overcoming or managing mood disorders and attention problems, and discusses some of the challenges that introverts can face when dealing with mental illness (approximately 10,000 words, including resources).
